

MAILGUARD SOLUTIONS

Leaders in SaaS Web and Email Security

Protection / Productivity / Profit

MAILGUARD

Secure Email Filtering

MailGuard proactively secures and protects networks from email-borne threats, assisting you to meet security and compliance objectives.

MailGuard proactively stops harmful viruses and spam from entering your network. Sitting outside the flow of network traffic, it filters all inbound and outbound email through multilayered protection systems located across our global data centres.

Supported by comprehensive email usage reports, MailGuard protects against the unauthorised distribution of confidential or commercially sensitive information by providing a 360 degree view of your inbound and outbound email traffic.

IMAGEGUARD

Email Image Filtering

ImageGuard is a professional image filtering service that detects inappropriate images being distributed via both incoming and outgoing email.

ImageGuard is a real time image analysis and management engine that assesses all image files passing through your mail server. Using robust policy sensitivity settings, it grades image risk to determine whether or not an image may be illicit in nature.

ImageGuard provides the technology to differentiate inappropriate images from the mass of legitimate business

images travelling through the email gateway on a daily basis. Once the image is identified as suspect, the email filtering application is able to record other details such as sender, recipient, date and time. Email details can be logged and reported to a database for review by HR or management. These reports give the organisation clear visibility of the level of the issue and the parties involved.

MAILGUARD LIVE

Email Continuity

Extended email availability ensures local system or infrastructure interruptions don't compromise email access across your organisation.

MailGuard Live offers a fully managed secondary mail system where employees have "always on" mail access to their Inbox in the event of a primary mail server outage.

MailGuard Live service goes beyond traditional email disaster recovery, not only guaranteeing email delivery via

queuing, but full email productivity – including sending, receiving, reading and composing emails - in a fully functional email environment and with full access to your personal address book. Staff access to the webmail client is by an authenticated log-in.

SAFEGUARD

Secure Email Archive

SafeGuard online email archive ensures legal and regulatory compliance, together with highly reliable email storage and real time retrieval.

SafeGuard business email archiving solution is a convenient and simple solution meeting legislative requirements to store email correspondence, whilst giving peace of mind that you have retained secure copies of all email traffic from your workstation or servers – regardless of whether it has been deleted.

SafeGuard provides an encrypted back-up of every email sent or received by your business each month - sender, recipient, date, time and attachments, just as they were sent over the internet.

MANAGED MAIL

Fully Redundant Managed Mailboxes

Managed Mail offers a cost effective, secure email infrastructure 'in the cloud' giving owners total control of their email communication.

Managed Mail offers quick and secure email infrastructure while reducing the cost of establishing and maintaining email systems in-house. Delivered as a fully redundant, managed service, Managed Mail is an affordable mailbox solution.

For a low monthly per-mailbox fee, owners stay in control of their email communication system, easily accessed through a web management interface.

WEBGUARD

Secure Web Browsing Management

WebGuard protects business networks, and the assets they contain, by eliminating malware and viruses before they reach your network.

WebGuard protects business networks from web-based threats by filtering web-browsing, and eliminating malware and viruses before they reach your network. It provides easy management of staff Internet usage by controlling access to

websites deemed unsuitable. WebGuard allows you to block or set time limits for staff web surfing or social networking which not only costs your business financially in terms of bandwidth usage, but also lost productivity.

What is Software-as-a-Service (SaaS)?

SaaS is a method of delivering software solutions over the internet, also known as 'in the cloud/cloud computing', rather than installing and maintaining software on a computer or network.

How Does it Work?

A SaaS solution requires no upfront investment or outlay as the software resides on a remote server and only attracts fees, on a subscription basis, as long as the service is active. There is no hardware or software installation required, translating to the SaaS application being up and running immediately.

Benefits

- Email and Web Risk is stopped at the internet level, not entering the network
- Bandwidth costs considerably reduced
- No dedicated IT resource required
- No hardware or software installation, upfront or ongoing
- Scalable and flexible based on the needs of the business
- Secure remote access to your applications
- Phishing, Spam, Viruses and other malicious threats are updated immediately, in real time as they evolve

MailGuard.

MailGuard is one of the largest providers of SaaS (Software-as-a-Service), addressing security, compliance and real-time risk intelligence, serving thousands of clients across 18 countries.
